Cardiologist
Mayo Clinic

“Holiday heart was originally termed for people who would go to parties around holiday time and drink a little too much alcohol.”

Mayo Clinic cardiologist Dr. Stephen Kopecky says doctors have known about the effects of alcohol on the heart for decades. Now they know there’s another holiday heart-related danger. High fat foods.

Mayo Clinic

“It’s been shown within 90 minutes, a big fatty meal with saturated animals fats will start to effect the lining of the arteries.”

That lining can become irritated, making it more likely to rupture or tear — then a clot could develop, block blood flow and cause a heart attack.

But, who can resist those rich holiday favorites?

Mayo Clinic

“So what do you do? Take less.”

Dr. Kopecky says by including some healthy choices on your plate, reducing the amount of fat you eat and alcohol you drink, you can still enjoy some of those holiday treats.
