### Dr. Summer Allen, M.D.  
**Family Medicine**  
**Mayo Clinic**

Dr. Summer Allen, a Mayo Clinic family medicine specialist, says symptoms usually last two to seven days.

### Dr. Allen

“And most people don’t require any treatment outside of fluids and some rest and making sure that they stay hydrated.”

### Graphic

**Risk of severe illness**
- Young children
- Older adults
- Weakened immune systems

Those at highest risk of severe illness are young children, older adults and those with weakened immune systems.

### Dr. Allen

“If someone feels they’re dehydrated, and they need to seek medical attention or have a condition that compromises their immune system, then they may need antibiotics.”

The bacteria live in the intestinal tract. It can spread from animals to humans and person to person. Good hand hygiene is one way to decrease your chance of infection.

### Dr. Allen

“If people wash their hands thoroughly or, in some cases, at least use hand sanitizer, that’s going to be extremely helpful and protective to them.”
