<td>Mayo Clinic orthopedic surgeons, like Dr. Sanj Kakar, are now using a new, state-of-the-art camera system to perform hand and wrist surgeries.</td>
<td>Dr. Kakar says it can be used to treat wrist fractures, ligament injuries, arthritis and more.</td>

Sanj Kakar, M.D.
Orthopedic Surgery
Mayo Clinic

"The camera is about half the size of traditionally used technology. It's flexible, so it allows us to get into spaces that we've struggled in the past, to see new things, to treat new conditions."

"Really, the use is endless. And we're not just talking about just arthroscopy. We're also talking about, for example, nerve decompressions at the elbow or at the wrist. It's basically allowing us to see things that we used to see with larger incisions through smaller incisions."

More minimally invasive surgeries may get patients back to their function quicker, with less pain and scarring.

"We're at the cutting edge, and here at Mayo Clinic we have the ability to do that, to really speak to our patients, inform them of what we're trying to do, and if we can get them back quicker and safer, then ultimately that's what we're trying to do in medicine here at Mayo Clinic."
